

Customer Segmentation for Snapdeal Using K-Means Clustering

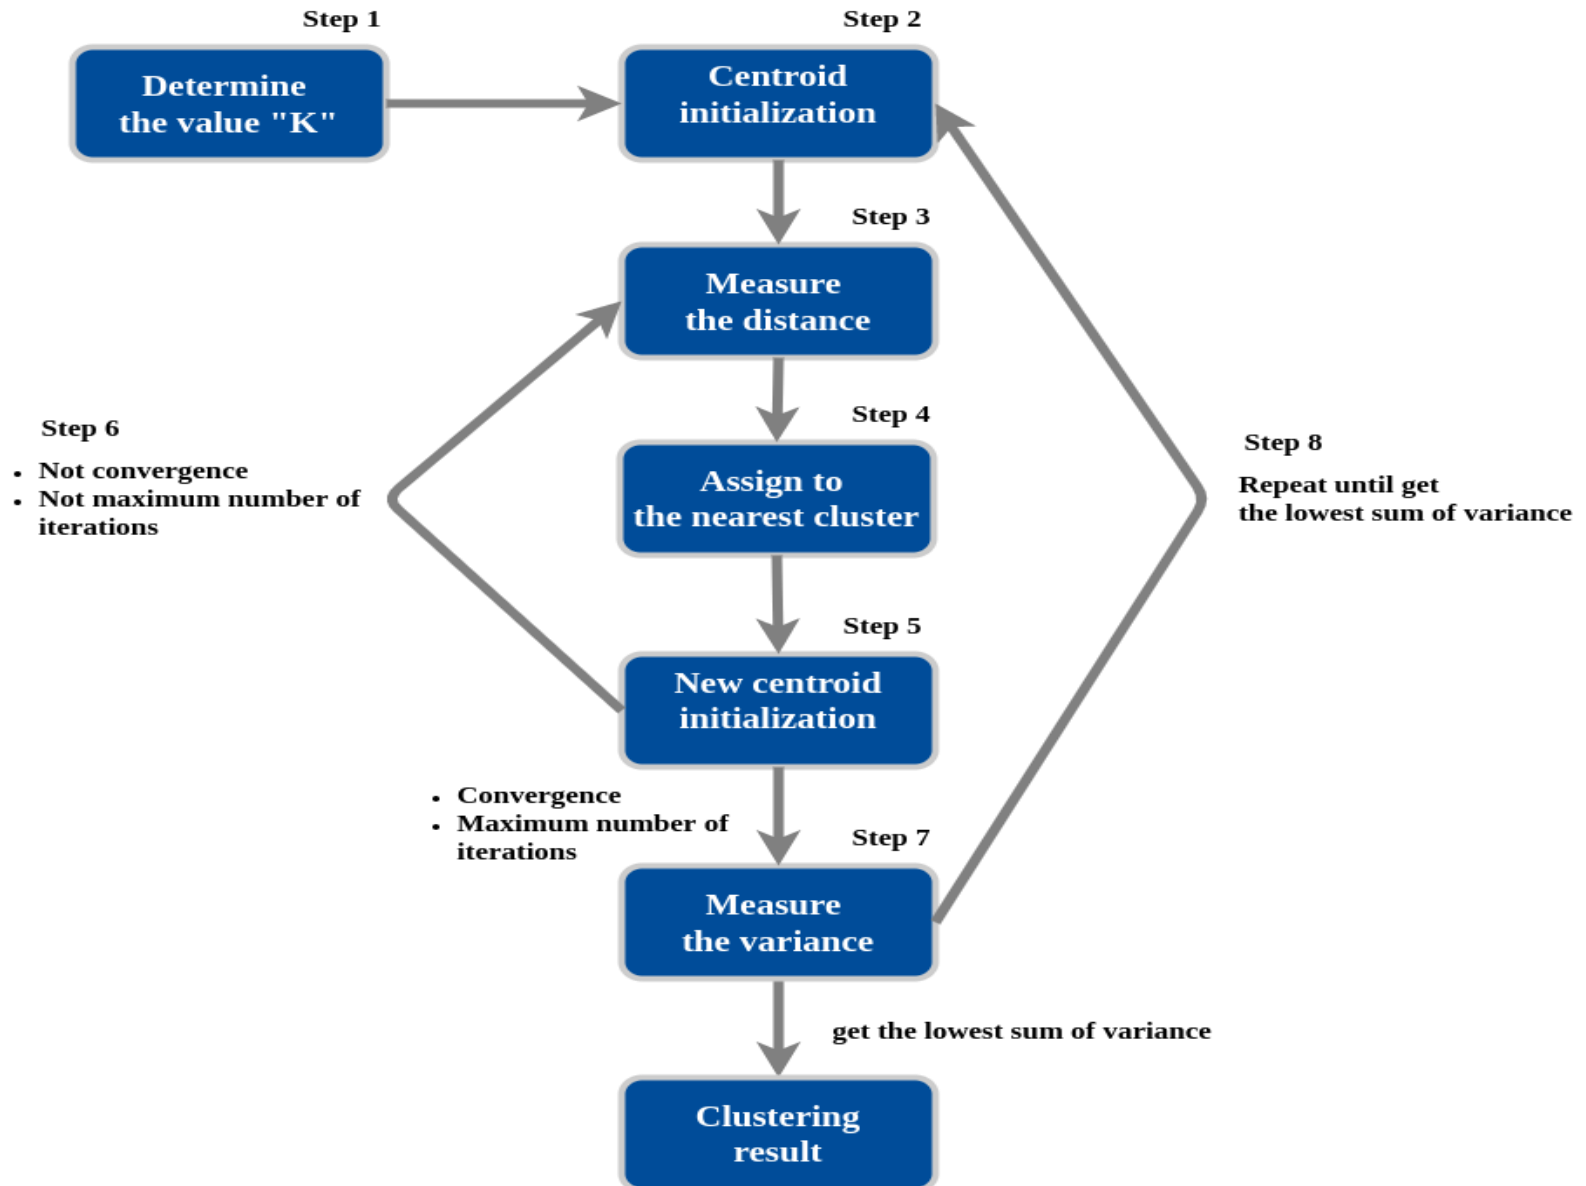

Data-Driven Insights for Personalized
Marketing

Author: Ravinder | April 2025

Objective

- Segment customers based on purchasing behavior using K-Means clustering.
- Enable personalized marketing, improve retention, and optimize inventory.

Steps of K-Means

Data Overview

- • Source: Online retail data from Snapdeal
- • Goal: Segmenting Customer by using k-means clustering
- • Key features: InvoiceNo, StockCode, Description, Quantity, InvoiceDate, UnitPrice, CustomerID, Country
- • Cleaned for missing values and returns.

Data Preprocessing

- - Removed missing and negative values
- - Engineered features:
 - - Frequency (number of purchases)
 - - Monetary Value (total spending)
 - - Recency (if available)

Elbow Method

- Elbow method used to identify optimal clusters

Sum of Squared Distances

Cluster Visualization

- 2D Scatter plot displaying clusters using frequency and monetary value

Answer

Answer Dart

K-Means Dart

Answer Basic

K-Means Basic

Answer Outliers

K-Means Outliers

Answer Spiral

K-Means Spiral

Answer Boxes

K-Means Boxes

Cluster Profiles

Cluster	Description	Frequency	Spending	Engagement
0	High-Value Customers	High	High	Strong
1	Occasional Shoppers	Medium	Medium	Moderate
2	Price-Sensitive Customers	Medium	Low	Promo-driven
3	One-Time Buyers	Low	Low	Weak
4	Dormant Customers	Previously high	Low	Inactive

Spending Trends by Segment

- Visual representation of spending across clusters

It visualizes the clustering results in a 2x3 grid of scatter plots, each representing one of the clusters. Each plot shows how the Quantity and Unit Price values are distributed within the respective clusters, with distinct colors representing different clusters. If any cluster has no data, it will be marked as "No Data".

Engagement Patterns

- Visualizing purchase frequency and recency to distinguish active vs. dormant users

Final Recommendations

- Personalized marketing campaigns per segment
- Loyalty and retention programs for high-value customers
- Targeted discounts for price-sensitive users
- Re-engagement campaigns for dormant users
- Optimized inventory based on segment behavior
- Regular model updates to track changing behaviors

Final Report

- • Insights from clustering highlight 5 key customer segments
- • Use behavior data to drive engagement and sales
- • Support strategic decisions with data-backed profiles

Conclusion

- K-Means clustering provided clear segmentation based on purchasing behavior.
- Enables targeted strategies for marketing, retention, and revenue growth.
- Continuous monitoring recommended to adapt to market shifts.
